# DIGITAL LAB NOTEBOOK OF KEVIN MURRAY

# Honours Project, 2013

Jointly supervised by Justin Borevitz and Barry Pogson

# Mon 2012-12-03

# Initial Harvest of Keng's RIX lines

## Aim

Harvest lines before the 1 week repeated HL stress experiment.

## Method

- Tissue was harvested into a 96 well tray of 8-strip  $\approx$  1mL tubes
- Single leaves were placed into the tubes, and snap frozen in liquid nitrogen.

## Results

The following table details the collection, including the plate layout

Well	Line	Comments

## Final Harvest of Keng's RIX lines

### Aim

Harvest lines after 1 week of HL stress.

## Method

- An Eppendorf 1.2mL deep well plate was placed on dry ice for  $\approx 10$  minutes before sampling to allow to cool.
- Whole leaves were excised and placed into 1.2mL Eppendorf 96 deep well plate.
- Where possible, the largest mature leaf was taken. In some cases, this was hard to determine, so the youngest of the fully-expanded leaves was taken (as this was generally also the largest leaf). Some plants were very small, and had only juvenile leaves, in which case the largest juvenile leaf was taken.

## Results

The following table describes the plate layout.

## MAKE: Washed Ball Bearings

## Method

- Aliquot approx 15mL of 3mm diameter steel ball bearings into 50mL falcon tube
- Add clean 100% ethanol
- Vortex for  $\approx 5$  minutes
- Remove ethanol, wash beads with milliQ or sterile water
- Dry in fume cupboard overnight

## TissueLyser grinding of practice samples

### Aims

To grind tissue from the excess tissue of Keng's RIX lines collected on 3/12/12.

### Method

- Remove pre-frozen TissueLyser blocks from -80 freezer.
- Add one cleaned bead to each Eppendorf tube (beads were not pre-cooled)
- $\bullet$  Pour LN<sub>2</sub> into the TissueLyser block
- Add Eppys with beads and sample, and run for 3x 1min runs at 29Hz
- Replace samples in -80

# Mon 2013-01-21

## Quantification of RNA samples

### Aim

• Determine qty of RNA in previously extracted samples

### Method

- Nanodropped RNA extraction from 15/1/13??
- Standard protocol, used sterile milliQ water as blank.

#### Result

• Of the 14 samples, 10 had reasonable amounts of RNA, and 260/280 ratios were above 1.8 in all but one case. (see ./2013-01/20130121-PracticeRNASamples.ods)

#### Attachments

- ./2013-01/20130121-PracticeRNAExtractionSamples.csv

- ./2013-01/20130121-PracticeRNASamples.ods

## MADE: 10x MOPS Solution

### Method

- Add 41.8g RNA only MOPS to beaker
- Add 450mL DEPC H2O, mix w/ stirrer bar on mag stirrer
- Add 26.6mL 3M Sodium Acetate (0.22um Filtered before use)
- Add 10mL RNA only 0.5M EDTA
- pH to 7 with 5M NaOH
- Top up to 500 mL with DEPC H2O
- Use 10ml per 100mL MOPS gel

## MADE: RNA Denaturing Gel (MOPS)

#### Method

- Melt 1g RNAase-free Agarose in 72ml DEPC H2O
- Add 10mL 10x MOPS
- Add 18mL 37% Formaldehyde
- Pour in RNA-only gel tank, previously washed with 0.5% SDS and RNAase-zap

## Tue 2013-01-22

## Denature RNA for RNA gels

### Method

- Dilute RNA to 100ng/μL
- Add RNA gel loading buffer (Obtained from Pete Crisp)
- Incubate at 65 degrees for 10 minutes. The samples were incubated for 10 minutes on the evening of 2013-01-21, but the gels were not run until 2013-01-22, so they were denatured for a further 2 minutes at 65 degrees

## TBE Gel

## Aim

• To compare TBE and denaturing/MOPS gels for RNA

## Method

- Dissolve 1g RNAase-free Agarose in 90mL DEPC water
- Add 10mL RNAase-free TBE (prepared using DEPC Water, obtained from Pete Crisp)
- Pour in RNA-only gel tank, previously washed with 0.5% SDS or RNAase-zap
- Then, load denatured samples, and run in RNAase-free 1x TBE
- Run at  $\approx 80 \text{V}$ ,  $\approx 40\text{-}50 \text{mA}$  for  $\approx 1.75 \text{h}$
- Stain gel in 0.5ug/ml Ethidium Br in DEPC water?? for 10 min on orbital shaker, and photograph.

### Result

See Figure 1 below.

Gel indicates some degradation of RNA, however most samples are OK. Sample order is (left to right) A2, A3, A5, A6, A7, B3, B5, B7. A7 appears to have no RNA, although this is probably a mis-loading error. Overall, the TBE gel appears to be of more use than the MOPS gel.

# MOPS gel

### Aim

• Determine quality of RNA and Compare MOPS with TBE for RNA gels

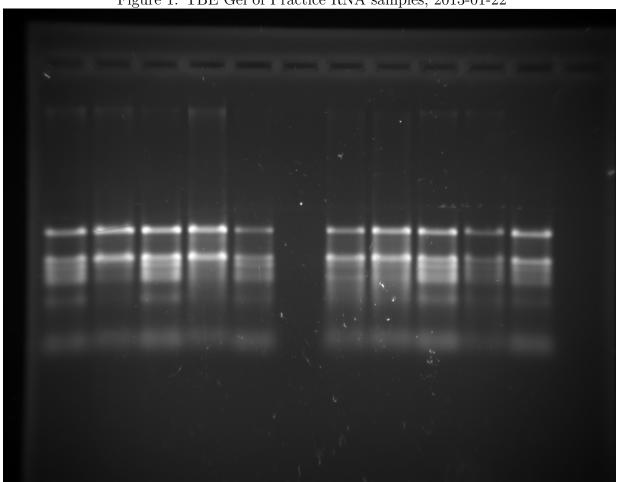

Figure 1: TBE Gel of Practice RNA samples, 2013-01-22

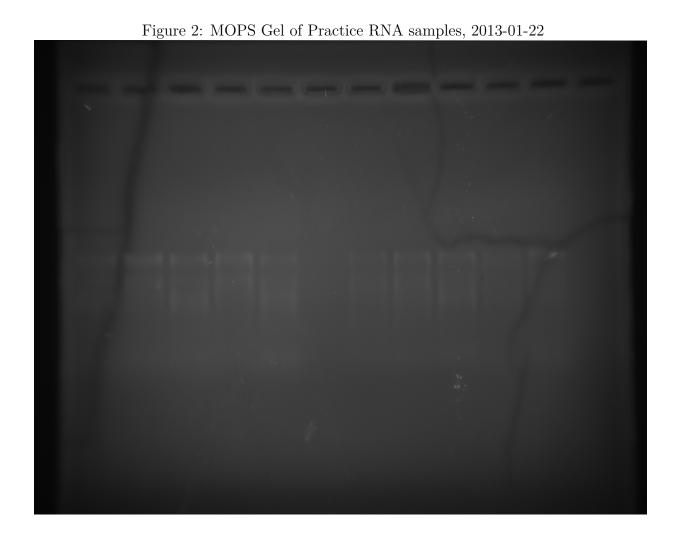

## Method

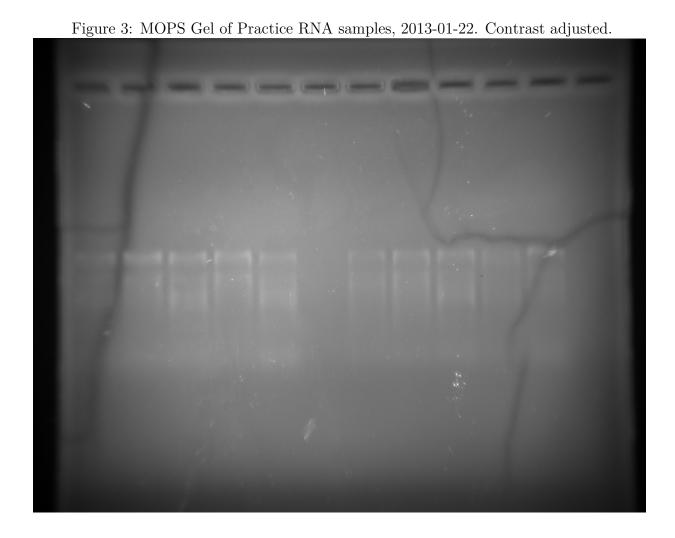

- Load samples after denaturing as above. Sample order is (left to right) A2, A3, A5, A6, A7, B3, B5, B7.
- Run gel in RNAase free 1x MOPS at  $\approx 80 \text{V}$ ,  $\approx 100 \text{mA}$  for  $\approx 1.75 \text{h}$  as per TBE gel above.
- Stain gel in 0.5ug/ml Ethidium Br in DEPC water?? for 10 min on orbital shaker.
- De-stain on orbital shaker gel in 1x MOPS, and photograph. Gel disintegrated whilst destaining.

## Results

See Figures 2 and 3

Mops gel confirms that the RNA was of reasonable quality. The MOPS gel appears to be of less use than the TBE gel.

# Tue 2013-01-29

## Seed Stock Levels

The stocks of Joost's RIX set were checked. Seed lines were classified as having either plenty (+), limited(?) or no (-) seed. The levels of each line are shown in the table below.

## Prepare Trays for Planting

Trays were filled with steamed seed raising mix, with 1 mL/L Osmocote® added and mixed before dispensing. Trays were filled by pouring potting mix over tall 5cm square pots, and compacting it with hands. 41 trays of 24 and one tray of 20 pots were made.

Once trays were made, they were watered with  $\approx 1.5 L$  RO water, containing  $\approx 1 mL/L$  AzaMax<sup>TM</sup>, covered with cling film and stored at 4 degrees C.

## Planting of RIX lines

## Aim:

Plant (ideally) 9 plants of each of the RIX lines, for the experiment Keng and I will conduct

## Method:

Seeds were planted in pre-prepared trays, by shaking from a piece of paper. Either 6 or 12 plants of each line, and some mutants, were planted in contiguous blocks. Once planted, trays were sprayed with a small amount of water and labelled by row, i.e. each row of plants consisted of one genotype, and only one pot was labelled per row. Plants were not randomised at this point. If the tray was dry, approx 0.5-1L of RO water was added.

The following table describes the lines which were planted. 12 plants of each line were planted, unless otherwise stated in the "Qty" columns below. From now on, lines will be referred to by their number in the following table.

Line Number	Line Name	Quantity

## Sun and Shade Spectra

### Aim

Measure specta from natural sun and natural shade at midday

### Method

- John Evan's spectroradiometer was used
- Measure every nm from 400 to 800
- Measurements taken at approx 12:30-1pm
- Measure clear, unobstructed sun with no clouds in quadrangle between forrestry, geography and Robertson buildings, ANU.
- Measure shade under elm tree in same location
- Calculations made by Pip Wilson, yielded umol photon per square meter per second per nanometer measures of intesnity. (see attached xls spreadsheet).

### Results

Overall PAR integrations were 38.0 and 1809.5 uE for shade and sun respectively. Spectra detailed in:

- 20130214-shade and sun spectra.xlsx MD5SUM db67505144fbd20ecc317a494f80ecde

## Creation of Solarcalc files

## Aim:

Generate the solar calc files which will be used to control the conviron growth cabinents and heliospectra lights for the duration of the latter part of the experiment.

### Method

 - Solar Calc version 2013 Feb<br/> C (zip file MD5SUM: 0b2b456771eb44ed1fa8ed1a087bfbd0) was used.

Location: Temora
Min Temp: 5 C
Max Humid.: 80
Start Date: 1/9/12
End Date: 31/12/12

• Shading: 0

• LED Ratios: 7.74 6.16 5.98 5.64 7.35 1.00 5.45

• 2010 weather

### Results

• Solarcalc output:

### Creation of Intermittent Bright/Shaded Solarcalc files

#### Aim:

Generate the solar calc files which will be used to control the conviron growth cabinents and heliospectra lights for the duration of the latter part of the experiment.

These files are to increase the brightness of the high light treatment.

#### Method

• SolarCalc version 2013 Feb C (zip file MD5SUM: 0b2b456771eb44ed1fa8ed1a087bfbd0) was used.

Location: Temora
Min Temp: 10 C
Max Humid.: 70
Start Date: 1/9/12
End Date: 31/12/12

- Shading: High Light file: 0, Low Light files: 45

- LED Ratios:

1x: 1.29 1.03 .94 1.22 0.17 .91 2x: 2.6 2.06 2 1.96 2.44 0.34 1.82

-2010 weather

• Then, the spliceSolarCalc.py script was used to splice between them, using the command line:

```
python spliceSolarCalc.py -o KMTemora2012Sep01_Intermittent2hLL1hHL.csv \
-f 2013-03/20130305-Temora2012Sep01_45shade_2010weather_LED-BetterNormalised.csv \
-F 2013-03/20130307-KMTemora2012Sep01_0shade_2010weather_LED-2xBetterNormalised.csv \
-1 120 -2 60 # 2h Low, 1h High
```

#### Results

### Enter plants in trayscan database

#### Aim

Allow trayscan to see and process out plants

#### Method

Using the tray registrator, the attached csv was registered in the database. The registration may have failed, PSI will fix the database to reflect it.

### Results

./2013-03/20130320-TrayscanImportSheet.csv MD5SUM: 69b97ec5cd3f30c10c0d7b21da59a35b

### Harvesting of practice tissue

#### Aim

Harvest unimportant tissue from extra plants to use for pracice RNA preps.

#### Method

- Plants had been grown since germination in convirons 8 & 9 under standard growth conditions
- Leaves were harvested from each plant into a 96-well 1.2mL plate on dry ice
- $\bullet$  the plant number as per ./2013-02/20130208-KMPlanted Lines.csv was recorded

- The plate was labelled "Harvest Tissue Plate", and stored in -80.
- The samples are laid out as described below:

	1	<b>2</b>	3	4	5	6	7	8	9	10	11	<b>12</b>

### Harvesing the First Replicate across each chamber

#### Aim

Harvest the actual experimental samples. Today, the first replicate will be harvested.

#### Method

- Leaves were taken from plants grown under experiment conditions (recorded by Keng, to be summarised later)
- Leaves were excised and genly rolled (where possible) between fingers, without breaking or squashing them. This allowed them to unroll to fill the edges of the wells in most cases, for faster freezing.
- Approx 1.5x1.5cm sections were taken when leaves exceeded this size. Tip end of leaves were taken if a leaf was torn. Leaves were torn once rolled by quckly plucking them with tweezers, using tweezer blades to cut the leaf.
- Harvesting started at 12:00. Detailed in the table below.

Time	Chamber	Condtion
12:00:00	2	0h
12:40:00	5	0h
13:00:00	4	0h
13:40:00	2 tray 1	1h HL (1h05 in HL)
13:55:00	5  trays  2  and  3	1h HL (30m in HL)
14:05:00	2  tray  2  and  3	1h HL (1h25m in HL)
14:15:00	5 tray 1	1h HL (1h15m in HL)
14:30:00	2	0h
14:45:00	4	0h
15:00:00	5	0h
15:40:00	2	1h HL (1h10m in HL)
16:00:00	4	1h HL (1h15m in HL)
16:15:00	5	1h HL (1h15m in HL)

### Harvesing the Second Replicate across each chamber

#### Aim

Harvest the actual experimental samples. Today, the second replicate will be harvested.

#### Method

- Leaves were taken from plants grown under experiment conditions (recorded by Keng, to be summarised later)
- Procedure was as per yesterday
- Leaves were excised and genly rolled (where possible) between fingers, without breaking or squashing them. This allowed them to unroll to fill the edges of the wells in most cases, for faster freezing.
- Approx 1.5x1.5cm sections were taken when leaves exceeded this size. Tip end of leaves were taken if a leaf was torn. Leaves were torn once rolled by quckly plucking them with tweezers, using tweezer blades to cut the leaf.
- Harvesting started at 11:30. Detailed in the table below.

$\mathbf{Time}$	Chamber	Condtion
11:30:00	4 part 1	0h
11:45:00	5 p1	0h
12:00:00	2 p1	0h
12:15:00	4 p2	0h
12:30:00	5 p2	0h
12:45:00	2 p2	0h
13:25:00	4 p1	$1 \mathrm{hHL}$
13:40:00	5 p1	$1 \mathrm{hHL}$
14:00:00	2 p1	$1 \mathrm{hHL}$
14:15:00	4 p2	$1 \mathrm{hHL}$
14:30:00	5 p2	$1 \mathrm{hHL}$
14:45:00	2 p2	$1 \mathrm{hHL}$

The plate layout is described below. Abbreviations are: S, small, 2S, 2x small (and so on), C, cauline leaves, sq, squashed leaf while harvesting, sen, some senescence on harvested leaf (only a small amount of senescence was allowed), P, purple/anthocyanin accumulation.

# Harvesing the Third Replicate across each chamber

#### Aim

Harvest the actual experimental samples. Today, the third replicate will be harvested.

#### Method

- Leaves were taken from plants grown under experiment conditions (recorded by Keng, to be summarised later)
- Procedure was as per yesterday
- Leaves were excised and genly rolled (where possible) between fingers, without breaking or squashing them. This allowed them to unroll to fill the edges of the wells in most cases, for faster freezing.
- Approx 1.5x1.5cm sections were taken when leaves exceeded this size. Tip end of leaves were taken if a leaf was torn. Leaves were torn once rolled by quckly plucking them with tweezers, using tweezer blades to cut the leaf.
- Harvesting started at 11:30. Detailed in the table below.

StartTime	Chamber	Tray	Condtion
1135	5	5+6	0h
1140	5	7	0h

### Trayscan Test

#### Aim

Test the tray registrator function of the trayscan, as instructed by Petr Ent.

#### Method

A test tray was made, and placed in the trayscan for PSI to test. The tray registration was as per the attached file: ./2013-04/20130426-TrayscanTest.csv MD5SUM: b6716d2b3c2b63adc36ef6d6a1a11104

### Corrected Trayscan Import File

#### Aim

Fix difference between the file which we imported into trayscan and the tray labels by which the phenotypic data was recorded.

#### Method

The format of the tray identifiers was changed to reflect the label format. No other changes were made. File attachement:

 $./2013-04/20130426-{\tt Corrected Trayscan Import Sheet.csv}$ 

MD5SUM: ba68cc9c73d63b648899dac35129ace5

### Count of all sampled plants

#### Aim

To determine the number of plants (for tim's abstract)

#### Method

The number of RIX, mutant and parental lines which survived to sampling week were counted.

Chamber:	2	4	5
	Fluctuating	Sufficient	Excess
overall	185	148	172
rix	158	122	145
Parental	15	14	15
mutant	12	12	12

## Mon 2013-05-06

### Development of Undistortion script

#### Aim

Trial parameters to Imagemagick's convert binary to get best undistortion of barrel distortion.

#### Method

To test the different parameters to the barrel undistortion model, the following command was run, with params substituted for the model parameters below. The original image was from the stardot 5mp webcams. convert -distort Barrel params> orig.jpeg undist.jpeg
The parameters below were tested:

- "0.0 0.0 -0.15 1.15"
- "0.0 0.0 -0.10 1.10"
- "0.0 0.0 -0.05 1.05"
- "0.0 0.0 -0.5 1.5"
- "0.0 0.0 -0.11 1.11"

#### Results

The parameters " $0.0\ 0.0\ -0.15\ 1.15$ " appeared to work best. Chromatic aberration is problematic. Will try to use fulla from the hugin toolkit.

## Wed 2013-05-15

### Creation of Caroline Chong's Solarcalc files

#### Aim

Create solar calc files for Caroline Chong's Pelargonium.

#### Method

- Solar Calc version 2013 Feb C (zip file MD5SUM: 0b2b456771eb44ed1fa8ed1a087bfbd0) was used.
- Location: Botrivier -34.219136°S, 19.195707°E
- Min Temp: 5 CMax Humid.: 85
- Start Date: 1/11/12End Date: 31/12/13
- End Date: 31/12Shading: 0
- LED Ratios: 4x: 5.2 4.12 4 3.92 4.88 1 3.64
- 2010 weather (current)

#### BotriverFuture.csv:

- SolarCalc version 2013 Feb C (zip file MD5SUM: 0b2b456771eb44ed1fa8ed1a087bfbd0) was used.
- Location: Botrivier -34.219136°S, 19.195707°E
- Min Temp:  $5~\mathrm{C}$
- Max Humid.: 85
- Start Date: 1/11/12
- End Date: 31/12/13
- Shading: 0
- LED Ratios:
  - $4x: 5.2 \ 4.12 \ 4 \ 3.92 \ 4.88 \ 1 \ 3.64$
- 2040 weather

#### TilbaCurrent.csv:

### Testing of tissuelyzer settings and protocol

#### Aim

Test which settings in the tissuelyzer are optimal for grinding tissue in 96 well plates.

#### Method/Results

- $\bullet~$  Remove plate containing tissue from -80, and place in tray with LN2.
- · Remove silicone tray mat, and repalce with Qiagen collection tube strip caps
- As the plates did not have ball bearings, I added LN2-frozen balls to the top of each plate.
- Freeze tissuelyzer blocks in LN2
- Pour LN2 into tissuelyzer base (the section with the rubber)
- Place plate with bottom in base, and put in machine. Don't add ln2 to the top of the plate
- Run machine (with counterbalance) for 1 min at 25hz
- Remove plate. After inspection, some wells were not pulverised, due to the bead being stuck, so i banged the plate against the desk quite hard about 5 times to dislodge it
- Run for another minute. The tissues appeared to have been ground more thoroughly.
- Spin plate at 6k RPM for 1 minute. This got most of the tissue to the bottom to the tube. Some remained around the lids, and seemed to thaw slightly.
- $\bullet~$  The plate was put back into the -80

## Thu 2013-05-16

### Practice Kumar et al Library Prep

#### Aim

Take two samples up to first strand synthesis

#### Method

Make fresh LBB and additives (hereafter LBBMA):

- Add  $6 \mathrm{mL}$  LBB from dynabeads kit to  $15 \mathrm{mL}$  falcon tube
- add 30uL mercapto ethanol and ≈ 90uL antifoam A. (antifoam A is V. viscous, could not be accurately pippeted)

#### Preps:

- Using practice plate from march harvest harvest, tissuelysed wed 15/5/13
- A2: Add 1mL LBBMA, pippete to mix, breif vortex, pipette into eppie, vortex again. Sample had many chunks which did not
  resuspend, spilt some lysates.
- A3: Add 500uL LBBMA, use 200uL pippetor to mix, then add extra 500uL and mix w/ 1000ul pippettor. Tfr to new tube. May
  not have added 500uL the second time, so added ≈ 200uL extra.
- Left A1 8min and A2 5min at RT
- Tfr -> qiashredder, spin 10k rpm, 10min
- Prepare dynabeads:

Resuspend bottle w/ v. gentle vortex

 $150 \text{uL} \rightarrow \text{fresh eppie}$ 

 ${\tt vortex, \, spin, \, mag \, sep, \, remove \, supn.}$ 

add 100u L<br/> LBBMA, resusp., centrifuge, resusp,  $50\mathrm{uL}$ ea to<br/> 2 new tubes

- mag sep, remove supn
- 200uL lysates -> each tube, rest of lysates onto dry ice
- pip to mix, incubate @ rt w/ hand mixing, 10min
- sep on mag sep, 15 min
- wash per protocol (steps 1.3 5-6) w/ LBBMA, not straight LBB
- $\bullet~$  leave in WBB 20min while DNAse MM was made
- Make 20uL DNAse MM per protocol, with 5% extra, using DEPC mQ water
- wash beads again w/ WBB (NOT Low Salt Buffer)
- add 18uL TrisHCL from dynabeads kit, resusp. 2uL -> extra tubes, for bioanalyser
- add 10uL DNAase MM to 15uL, incubate 10min at 37C in pcr machine
- add  $1.5\mathrm{uL}~0.22\mathrm{uM}$  filtered EDTA, pip to mix, incubate 75C for  $10\mathrm{min}$
- samples -> ice for 10min, add 175 LBBMA, mix
- incubate RT with hand mixing 10min
- mag sep beads for 10min
- wash per steps 1.3 5-6, but w/ 150uL WBA for sample A3 in step 5
- Wash w/ 200uL WBB again (not LSB)
- Make 13uL primer/dntp mix:

10mM Tris from dynabeads kit, 11.6uL

25mM DNTPs from Pete

Random primers from sigma

- incubate, prepare FS cDNA MM, add sample and run synthesis rxn in PCR machine as per protocol, steps 1.3 step 18 2.1 step 5
- Freeze sample at -20C

#### Results

None yet

## Thu 2013-06-06

### Create Condtions for keng

#### Aim

Make solarcalc conditions for keng.

#### Method

as described in the .srp files attached.

#### Results

 $2013-06/20130606-Griffith Current 100 Light.srp\ 2013-06/20130606-Griffith Current 100 Light.csv\ 2013-06/20130606-Mildura Current 100 Light.srp\ 2013-06/20130606-Temora Current 100 Light.csv\ 2013-06/20130606-Temora Current 100 Light.srp\ 2013-06/20130606-Temora Current 100 Light.csv\ 2013-06/20130606-Umea Current 100 Light.csv\ 20$ 

### Spanish conditions

#### Aim

Create some inland spanish inland/coastal conditions for comparison.

#### Method

See .srp files attached

#### Results

The inland condition is too cold, so we won't use these.

### Extraction of samples from plates

#### Aim

Get the col, cvi and ler samples out of the plates for RNA extraction

#### Method

- Plates were placed in liquid N2, and allowed to cool.
- $\bullet\,\,$  Qiagen collection tube caps were used to close the plates
- individual caps were cut away and sample disrupted w/ a ln2 frozen p1000 tip
- contents were emptied into pre labeled and pre ln2 frozen eppies (normal 1.7ml ones)
- plates were re-capped with collection tube caps, and plate mats strapped to plates w/ cotton thread to stop explosions.
